

THIS IS NOT A BUMBLEBEE

# THIS IS NATUPOL **BOOSTER**

**HI-PERFORMANCE POLLINATION**

**THE BEST POLLINATION VALUE AVAILABLE!**

Natupol Booster was specially developed to enable the very best pollination results in crops with a flowering period of between one and four weeks. The product offers growers of these crops the best value for their money and has the potential to provide growers worldwide with a new pollination solution. What are the factors which make this possible?

#### **Global market leader**

Koppert Biological Systems is the global leader in the market for natural pollination with bumblebees. We achieved this position because of our constant focus on quality and service. All over the world, growers in more than 120 different crops work with Koppert bumblebee colonies.

#### **Guaranteed quality**

All Koppert production locations are subject to protocols and strict, independent veterinary checks, guaranteeing that we produce bumblebees of only the very best quality. This is true for Natupol Booster, as well!

***Natupol Booster offers you the best value available. Are you curious about what this product can mean to your company? Go to our dedicated website [www.natupol.com](http://www.natupol.com) or contact us at no obligation. We will be happy to answer all your questions about Natupol Booster!***

### Highly effective pollination

Research consistently shows that bumblebees are extremely reliable and effective pollinators. Bumblebees have a strong tendency to remain in the plot where they are released, and they fly even during cold, windy, or wet weather. As a result, they visit more flowers per hour and transfer more pollen per individual than most other pollinators. Pollination that is this thorough pays off in higher production and better fruit quality!

### Natupol Booster: Hi-Performance Pollination

Natupol Booster was specially developed for the cultivation of crops with a short flowering period, in which pollination must occur within a period of one to four weeks. The Natupol Booster bumblebees work quickly and intensively and boost pollination. We call that 'Hi-Performance Pollination'. Of course it is always important, but it's particularly essential when the growing season does not go as smoothly as desired, good production is at risk, and the prices for the harvested product may increase.

### The best hive

The patented Natupol Booster hive contains 80% less plastic and is extremely environmentally friendly and sustainable. The hive is well-insulated, but it also has extra ventilation so it can be used in warmer climates. This ideal combination of insulation and ventilation keeps the interior temperature perfect, so the bumblebee colony will perform better.

### The most reliability

Koppert is an extremely reliable supplier. Providing you order them in time, Koppert hives are always available and delivered when you need them. This means that growers can always get the hives they need, giving them one less thing to worry about!

### Extensive service

Koppert provides extensive service to bumblebee colony users. The latest knowledge and tailored advice ensure that users can get maximum yield from their pollination. Growers using Natupol Booster receive all the support they require!

### For a wide range of crops

Natupol Booster was specially developed for the cultivation of crops with a short flowering period. This includes crops such as strawberries, raspberries, blackberries, plums, apricots, sweet cherries, sour cherries, avocado, kiwi, pumpkin, watermelon, apple varieties, pear varieties, seed-producing crops, and fodder crops like clover and alfalfa.
